

What This System *Actually Does*

An overview of how the cold-call automation works, written for anyone — no engineering background required. Read in five minutes.

§ 01 The One-Sentence Version

A robot reads a list of dental practices from HubSpot every morning, calls each one during their local business hours, leaves the same human-recorded voicemail you'd leave manually, and writes the results back to HubSpot so the team can see what happened.

TODAY • MANUAL

One person, six hours, a hundred dials.

- Open HubSpot, scroll to next contact
- Dial number, wait for ring or voicemail
- Read script aloud if voicemail picks up
- Hang up, type a note in HubSpot
- Repeat 99 more times

TOMORROW • AUTOMATED

A robot, all day, one dashboard at the end.

- + System wakes up, reads the curated list
- + Calls each practice in their own time zone

- + Plays the same voicemail you would have
- + Logs every outcome automatically
- + You check the dashboard, not the phone

§ 02 A Day in the Life

What happens between sunrise and sunset, step by step.

6:00 AM

STEP ONE

The system wakes up and reads your list.

Every morning, the system logs into HubSpot, opens the curated list of dental practices, and pulls down today's call targets. **You decide who's on the list** — the system just dials whoever you put there.

6:05 AM

STEP TWO

It plans the day around each practice's time zone.

A practice in Dallas gets called when it's mid-morning in Dallas. A practice in Los Angeles gets called when it's mid-morning in LA. Every contact gets **two attempts** — once between 10:00–11:30 AM their time, once between 2:00–3:30 PM.

10:00 AM

STEP THREE

Calls start going out, automatically.

As local mid-morning hits each city, the system starts dialing. Calls happen in the background — **no one needs to be at a desk**. The dialing tool (Twilio) places the call, then waits to find out what happened.

All Day

STEP FOUR

Each call gets handled based on who picks up.

If voicemail picks up, the system plays your pre-recorded message in full. If a human picks up, it **hangs up silently** and marks the call for a human follow-up. Either way, the outcome is logged within seconds. (See §03 for the four possibilities.)

*After Each
Call*

STEP FIVE

Results flow back into HubSpot, automatically.

A call activity is added to that contact's timeline in HubSpot — same as if your team had logged it manually. Two fields get updated too: **"Last Call Attempt"** and **"Last Call Outcome"**, so you can filter and report on them.

End of Day

STEP SIX

You check the dashboard, not your phone.

A single page shows you everything that happened: who got called, when, and what happened. **No one had to dial a single number.**

§ 03 One Call, Four Possible Outcomes

Every dial ends in one of four ways. The system knows which one happened and records it.

1 **Voicemail Left**

The desired outcome. Your message played in full.

2 **No Answer**

The phone rang out. Try again next cycle, or move on.

3 **Human Answered**

4 **Failed / Busy**

Flagged for a real person to follow up —
no robocall.

Bad number, blocked carrier, etc.
Logged for cleanup.

§ 04 What You See at the End of the Day

Two places to check, both updated automatically as calls happen.

In your *dashboard*

A single page showing today's progress. Total dialed, what happened, who needs human follow-up.

87 / 100

CALLS COMPLETED TODAY

Dr. Patel • Sunset Dental	VM
Dr. Chen • Bayview Family	NA
Dr. Reyes • Lone Star Smiles	Human
Dr. Adler • Westwood Dental	VM

In *HubSpot*

Each call shows up on the contact's timeline, just like a manually-logged call. Two new fields let you filter and report on outcomes.

Dr. Patel • Sunset Dental

 Outbound Call • 32 sec

Today • 10:42 AM CT

Last Call Outcome:

Voicemail Left

§ 05 What It Cannot Do *(yet)*

Honest about the limits. These are explicitly Phase 2 — not part of the first build.

LIMIT 01

It can't talk to a human.

When a dentist picks up live, the system hangs up. A real person follows up. Adding an AI agent that holds a conversation is the obvious next step.

LIMIT 02

Every voicemail is identical.

Same recording for all 100 practices. Personalizing by practice name or location would lift callback rates, but adds complexity.

LIMIT 03

It doesn't handle callbacks.

If a dentist calls back, they reach voicemail or whoever you point the number at. Smart call-routing is a later add-on.

LIMIT 04

It doesn't research practices.

It dials whoever's on the list, in the order you specify. Prioritization by practice quality, recent news, or signals is a separate layer.
